

**PROJECT DESCRIPTION:**

The East Dunne Booster Station Rehabilitation modifies existing water pumps to better serve the water demand and fire needs of the Holiday Estates Area. New pumps will also be added to convey water through the then completed East Dunne Water Transmission Main Project to the future 850,000 gallon storage reservoir on the hillside east of Flaming Oaks Court. The completed booster station rehabilitation project will reduce energy consumption and improve water delivery reliability. Construction is expected to start in August 2016.

This project is one of many related projects to improve fire protection by increasing water storage, water reliability and water availability for the Holiday Estates area.
